

LSS Tubular Oil (Gas) Steam Boiler

The furnace pipe of the products uses water pipe tubular, vertical three-pass, and the burner is placed on the top. Fire extends from the top down with long flame and full combustion, and smoke transfers heat through three-pass, which greatly reduces heat loss in boiler warm-up and shutdown, improving thermal efficiency. Protective function of contactor, the double backflow prevention and exhaust thermal protection devices can enhance security.

- Quick start of cold furnace can realized temperature and pressure rise during a short period of time;
- Forced circulation, full combustion, reducing NOx emissions;
- With multiple chain protection for water level, steam pressure, overheating;
- Multi steam and water separation technology, quality steam; external steam and water separator has national invention patent. (Patent is protected);
- The vertical structure is compact and beautiful, elegant and bright in color, which saves space and easy for installation.
