

HD-500RS BOILER WATER SOFTENER

Product features

HD-500RS Water Softener is an ion exchange softener, adopts the most advanced flow rate/time computer controlled system, operation and regeneration process are automatically controlled. Incoming hard water passes through the tank containing high-capacity ion exchange resin beads supersaturated with sodium.

The calcium and magnesium ions in the water attach to the resin beads, replacing the sodium, which is released into the water. The softened water is then distributed for use. So as to make no fouling or scaling and

attaching to the container or boiler. Greatly improve the service life of the boiler and its working efficiency. HD-500RS has the following characteristics: setting the backwashing intervals, whereby multiple

runs of backwashing time, set the interval numbers according to the turbidity of local water. It can provide

two kinds of flow rate mode, flow-delay type and timely-flow type. According to the water use level of the

boiler, set the size of flow rate through the water softener.
